

How is chlorine stored?

Chlorine is stored as a liquid at ambient or low temperature. It can be used as a feedstock for on-site processes or loaded into containers, road, or rail tankers. Due to its high toxicity, the storage area must be carefully monitored, and special care must be taken during loading operations.

How does a chlorine gas system work?

Chlorine gas is pumped into the cupric chloride or ferric chloride. The chlorine gas reacts with the spent etchant to regenerate the free acid and cupric or ferric chloride. Chlorine gas systems will need a water input as well to keep the specific gravity under control. Then the etchant is ready to etch metal.

How does a chlorine room work?

These are screen shots of my chlorine room for treating germy water or polluted water. Three liquid reservoirs sit in a chlorine room with air pressure around 1000 grams per tile. There are two unpowered mechanized doors controlled by clock sensors. When a door is open below the liquid reservoir then its accumulated liquid cannot flow out.

While the future of energy will be renewable, there are no "miracle" solutions and it is important to make things clear. The episode of LE IENE entitled "Renewables, the storage and battery revolution" generated a great deal of interest in molten salt batteries, which, however, are neither a new nor a perfect technology. Here we analyse how it works, and the pros and cons.

In the scope of developing new electrochemical concepts to build batteries with high energy density, chloride ion batteries (CIBs) have emerged as a candidate for the next generation of novel electrochemical energy storage technologies, which show the potential in matching or even surpassing the current lithium metal batteries in terms of energy density, dendrite-free ...

The chloride ion battery possesses a theoretical energy density of up to 2500 Wh L⁻¹ for selected electrochemical couples of electrodes [15], which can compete with many advanced energy storage technologies, such as Li-S, or even Li-O₂ batteries. One key advantage of this battery is the use of a chloride ion containing electrolyte and ...
