How does a flywheel energy storage system work?

A flywheel energy storage system works by spinning a large, heavy wheel, called a flywheel at very high speeds. The energy is stored as rotational kinetic energy in the spinning wheel. When electricity is needed, the flywheel's rotational speed is reduced, and the stored kinetic energy is converted back into electrical power using a generator.

What is China's largest flywheel energy storage plant?

China's massive 30-megawatt (MW) flywheel energy storage plant, the Dinglun power station, is now connected to the grid, making it the largest operational flywheel energy storage facility ever built.

How efficient is flywheel energy storage?

Datasheet from a long term flywheel energy storage retailer shows their solution at ~86% efficient. The full details give a better view: a 32kWh storage what consumes 55W when idle and consumes 140W when charging/discharging at 8kW. For off-grid where you store the power for 20 hours at time the 55W draw will be pretty costly.

The facility has a power output of 30 MW and is equipped with 120 high-speed magnetic levitation flywheel units. Every 10 flywheels form an energy storage and frequency ...

E = ½Io2. I is the moment of inertia, which depends on the actual mass and the location of that mass from the spinning center - the farther out it is the higher the moment of inertia becomes.
