How does energy storage work in a wind farm?

After energy storage is integrated into the wind farm, one part of the wind power generation is sold to the grid directly, and the other part is purchased and stored with a low price, and then is sold with a high price through the energy storage system.

How does a wind farm work?

All the electricity from the wind farm without energy storage is sold to the grid and users. The annual revenue is 12.78 million US dollars. When integrating the energy storage plant, it stores the wind power when the electricity price is low, and releases it when the price is high.

Based on these data, we can get the average subsidy level for wind power which is 153.29 yuan/MWh (572.06-418.77). Thus, under the premium pricing mechanism, the average on-grid electricity price for wind power is "market clear electricity price + 153.29 yuan/MWh".

One simple format of the static TOU tariff is the peak and off-peak pricing. The peak and off-peak pricing differentiates electricity price between peak and off-peak period during a day, see Fig. 1. In the peak hours consumers will be charged with higher electricity price whereas in the off-peak hours with lower price (Herter et al., 2007). 1
