

# How long does it take to cure urinary retention

How is urinary retention treated?

Urinary retention is treated differently based on whether it's acute or chronic. For acute urinary retention, a catheter is inserted to drain the bladder, providing almost immediate relief. After that, the cause is determined, and appropriate treatment is initiated. Chronic urinary retention treatment depends on the underlying cause.

What is the first step in treating chronic urinary retention?

If you have chronic urinary retention, your health care professional will first try to diagnose and treat the cause of your retention. However, your health care professional may need to use a catheter to drain the urine from your bladder if the retention continues or becomes severe.

What happens if I have chronic urinary retention?

If you have chronic urinary retention, your healthcare professional will first try to diagnose and treat the cause. However, if the retention continues or becomes severe, they may need to use a catheter to drain the urine from your bladder.

How does acute urinary retention occur?

Acute urinary retention is characterized by an inability to pass urine. When it occurs, a health care professional will immediately drain the urine from your bladder using a catheter to ease your pain and prevent damage to your bladder and kidneys.

Does chronic urinary retention need emergency treatment?

Chronic urinary retention doesn't usually need emergency treatment. However, it should be evaluated to reduce the risk of infection and damage to the kidneys. Bladder re-training and biofeedback training can help your child understand the messages travelling between the bladder and brain and strengthen the muscles so weeing is easier.
