How much lithium is needed per kWh?

If one therefore allows 400 g of Lithium (2.1 kg LCE) per battery kWh with a 70% processing yield to produce that, an initial 3 kg of raw technical grade Lithium Carbonate will be required per kWh of final usable battery capacity.

How much lithium does a cathode battery need per kWh?

In a more detailed report³ from ANL, estimates are presented varying between 113 g and 246 g of Lithium (600 g and 1.3 kg LCE) per kWh for various cathode types of batteries all with a graphite anode, with a Lithium titanate spinel anode battery having a high requirement of 423 g Li (2.2 kg LCE) per kWh.

How much lithium do EV batteries need?

This translates into a Lithium requirement of at least 320 g of Lithium (1.7 kg LCE) per kWh of available capacity. In addition, Lithium has to be added to this for the electrolyte, irreversible capacity loss and capacity fade. EV batteries will be 25% oversized to account for capacity fade.

How many grams of lithium carbonate in 1000 watt hours?

Therefore from a purely theoretical perspective, 1000 Watt Hours or 1 kWh of energy, the basic unit of energy we consider for EV battery storage, would require $1000 \div 13.68 = 73$ grams of Lithium metal. This equates to 385 grams of Lithium Carbonate.
