Is binary production technology a viable option in low and medium temperature geothermal fields?

The binary production technology has recently become competitive due to higher energy prices and subsidies to electricity generated with renewable energy resources. The binary technology for production of energy from geothermal resources is therefore an option worth assessing in low and medium temperature geothermal fields.

Can a binary power plant produce electricity from geothermal resources?

The main conclusion of this study is that the economy of a binary power plant depends highly on the characteristics of the geothermal area, i.e. depth to the water level and pumping requirements. Binary technology is feasible for the production of electricity from geothermal resources at temperatures 120°C and up.

How do binary cycle power plants work?

The working principle of binary cycle power plants is based on the use of a secondary working fluid to transfer heat from the geothermal fluid to a turbine, where it is converted into electricity. There are several types of binary cycle power plants, including air-cooled, water-cooled, and hybrid systems.

What are some examples of energy storage applications?

Energy storage applications include electrodes in rechargeable lithium- and sodium-ion batteries, lithium-sulfur batteries, and supercapacitors. In terms of energy conversion, photocatalytic fuel production, such as hydrogen evolution from water splitting, and carbon dioxide reduction are presented.

How long does it take to supply a binary power plant?

Lead time for supply of a binary unit is currently 12-24 months depending on size. There is an increasing number of companies that offer complete binary power plants. The list is not exhaustive. Atlas Copco is an industrial group producing compressors, construction and mining equipment, power tools and assembly systems.

What is a binary power plant?

The binary technology allows for production of electricity from low temperature resources that otherwise could not be used for such a purpose. In a conventional steam power plant, the turbine is driven directly by the steam for power production whereas in a binary plant, the geothermal fluid is used indirectly.
