

How to store the electricity generated by flywheel

What happens when energy is required from a flywheel energy storage system?

When energy is required from the flywheel energy storage system, the kinetic energy in the system is transformed into electric energy and is provided as output. Electrical energy or mechanical energy is used to spin the flywheel at great speeds and to store energy.

What is a flywheel energy storage system?

Flywheel energy storage systems (FESS) are a great way to store and use energy. They work by spinning a wheel really fast to store energy, and then slowing it down to release that energy when needed. FESS are perfect for keeping the power grid steady, providing backup power and supporting renewable energy sources.

How a flywheel energy storage system is compared to a battery?

Flywheel energy storage can be compared to the battery in the same way. The flywheel energy storage system uses electrical energy and stores it in the form of kinetic energy. When energy is required from the flywheel energy storage system, the kinetic energy in the system is transformed into electric energy and is provided as output.

Can flywheel energy storage be used in electric vehicles?

Yes, flywheel energy storage can be used in electric vehicles (EVs), particularly for applications requiring rapid energy discharge and regenerative braking. Flywheels can improve vehicle efficiency by capturing and storing braking energy, which can then be used to accelerate the vehicle, reducing overall energy consumption.

How does a flywheel retain energy?

Energy Storage: The flywheel continues to spin at high speed, maintaining energy as long as friction and resistance are minimized. The longer it spins, the more energy it holds, similar to how the skater retains rotational energy as they keep spinning.

How does a flywheel convert energy to kinetic energy?

Using the flywheel's rotational speed, the electric energy produced by the generator is converted to kinetic energy. The energy is then stored by increasing the rotational speed of the flywheel. Slowing the flywheel converts the stored energy to electric energy via the generator.
