Energy storage is an effective method for storing energy produced from renewable energy stations during off-peak periods, when the energy demand is low [1] fact, energy storage is turning out nowadays to be an essential part of renewable energy systems, especially as the technology becomes more efficient and renewable energy resources increase.

In scenario 2, energy storage power station profitability through peak-to-valley price differential arbitrage. The energy storage plant in Scenario 3 is profitable by providing ancillary services and arbitrage of the peak-to-valley price difference. The cost-benefit analysis and estimates for individual scenarios are presented in Table 1.
