Is hydrogen a viable option for electric scooters and motorcycles?

At the same time, the network of hydrogen stations in Germany is projected to grow from 100 to 400 over the next three years. Yet hydrogen is not currently an option for small vehicles such as electric scooters and motorcycles, since the pressure surge during refilling would be too great.

Is hydrogen the future of e-scooters?

Hydrogen is regarded by many as the future of propulsion technology. The first hydrogen-powered cars are already in action on German roads. In the case of e-scooters, however, installation of a high-pressure tank to store the hydrogen is impractical. An alternative here is POWERPASTE.

Do e-scooters need a high-pressure tank?

In the case of e-scooters, however, installation of a high-pressure tank to store the hydrogen is impractical. An alternative here is POWERPASTE. This provides a safe way of storing hydrogen in a chemical form that is easy to transport and replenish without the need for an expensive network of filling stations.

An electric scooter, also called e-scooter, is a battery-powered motor-driven two-wheeler. The main source of energy to propel the electric scooter is electricity which is considered the cleanest form of energy. An electric scooter does not have an engine to drive the wheels, instead it consists of an electric motor that turns the wheels.
