

How can energy storage systems meet the demands of large-scale energy storage?

To meet the demands for large-scale, long-duration, high-efficiency, and rapid-response energy storage systems, this study integrates physical and chemical energy storage technologies to develop a coupled energy storage system incorporating PEMEC, SOFC and CB.

How does energy storage work?

As shown in Table C1, Table C2, during the energy storage process, the air is heated to  $564\text{ }^{\circ}\text{C}$  at the compressor outlet. The air then stores heat in solar salt, raising its temperature to  $554\text{ }^{\circ}\text{C}$ .

What are the different types of energy storage technologies?

Existing energy storage technologies can be categorized into physical and chemical energy storage. Physical energy storage accumulates energy through physical processes without chemical reactions, featuring advantages of large scale, low cost, high efficiency and long duration, but lacks flexibility.

What is physical energy storage?

Physical energy storage includes mature technologies such as pumped hydro storage (PHS) and compressed air energy storage (CAES).

Can energy storage combine CB and hydrogen?

This study proposes an integrated energy storage system combining CB with hydrogen energy storage. During the energy storage process, CB acts as the base load to absorb large-scale surplus electricity, while PEMEC serves as the regulating load, flexibly absorbing fluctuating power.

How to calculate RTE and exergy efficiency of hydrogen energy storage system?

The round-trip energy efficiency (RTE) and exergy efficiency of the hydrogen energy storage system are defined as follows:  $\eta_{ex,h} = \frac{W_f + W_{e,H2}}{W_c + W_{e,H2}}$  where  $W_{e,H2}$  is the power generated by the H<sub>2</sub> expander of the SOFC subsystem, kW;  $W_{c,H2}$  is the power input of the H<sub>2</sub> compressor of the PEMEC subsystem, kW.
