

What is inductive reactance?

Inductive reactance is the opposition that an inductor offers to alternating current due to its phase-shifted storage and release of energy in its magnetic field. Reactance is symbolized by the capital letter "X" and is measured in ohms just like resistance (R).

What is the rate of energy storage in a Magnetic Inductor?

Thus, the power delivered to the inductor $p = v \cdot i$ is also zero, which means that the rate of energy storage is zero as well. Therefore, the energy is only stored inside the inductor before its current reaches its maximum steady-state value, I_m . After the current becomes constant, the energy within the magnetic becomes constant as well.

What are some common hazards related to the energy stored in inductors?

Some common hazards related to the energy stored in inductors are as follows: When an inductive circuit is completed, the inductor begins storing energy in its magnetic fields. When the same circuit is broken, the energy in the magnetic field is quickly reconverted into electrical energy.

How does Linear Technology affect inductor energy storage?

While one inductor's current is increasing, the other's is decreasing. There is also a significant reduction in the required inductor energy storage (approximately 75%). The inductor's volume, and therefore cost, are reduced as well. See Linear Technology's Application Note 77 for complete details.

Why is all power in an inductor reactive?

All power in an inductance is reactive because it merely shuttles into and out of the inductor and never leaves the circuit. An inductor's opposition to change in current is an opposition to alternating current in general, which is by definition always changing in instantaneous magnitude and direction.

How to calculate inductive reactance of an inductor?

The inductive reactance (X_L) of an inductor, measured in Ohms, can be calculated using the provided formula. $X_L = 2\pi fL$ In the given context: X_L represents the inductive reactance measured in Ohms (O). π (pi) is a constant with a numerical value of 3.142. f denotes the frequency in Hertz (Hz). L stands for inductance measured in Henries (H).
