In the literature, tramway propulsion systems have been developed using SuperCapacitors (SC) and Lithium Ion Batteries (LIB), the SC having a specific power higher than the battery and very high efficiencies, about 95% should work as an Energy Storage System (ESS) together with the (LIB) that has a specific energy higher than the SC that avoids the ...

This paper describes a hybrid tram powered by a Proton Exchange Membrane (PEM) fuel cell (FC) stack supported by an energy storage system (ESS) composed of a Li-ion battery (LB) pack and an ultra-capacitor (UC) pack. This configuration allows the tram to operate without grid connection. The hybrid

The energy consumption of a tram with a flywheel system is compared to the consumption of a conventional tram without an energy storage device and a tram with a storage device based on supercaps. Finally, the influence of the grid feed-in power limit on the energy savings is analyzed. Key words Flywheel, Energy Storage, Tramway, Train, Energy

On the Paris T3 tramline, a Citadis tram has been fitted with a bank of 48 supercapacitors to simulate catenary-free running. Alstom is also trialling flywheel storage on a tram in Rotterdam. This is roof-mounted and runs in a vacuum at speeds around 20,000 rpm providing a net energy storage of 4kWh and 325 kW peak power.

PESA Bydgoszcz will expand its tram portfolio with a two new tramway platforms, called Swing 3.0 and Twist 3.0. These are primarily new vehicle architectures, which essentially represent a further development of the existing Swing, Jazz, Twist and Foxtrot trams. The classic Twist tram is a bogie vehicle with steps above the bogies in the interior.

Subsequently, this study designs two energy storage systems (ESSs), the EV energy storage system (EVESS), which solely exploits EV batteries for energy storage, and the combined ESS (CESS), which integrates the EVs with a sub-system of a stationary battery. Both ESS arrangements were found to successfully deliver energy-saving to the tram system.

Implementation of energy storage system on-board a tram allow the optimised recovery of braking energy and catenary free operation. Figure 3 shows the schematic which allows energy storage to be implemented on-board a tram. The braking resistor is installed in case the energy storage is unable to absorb braking energy. The energy flow

Energy conservation running for vehicle has been a promising research hotspot in the many universities and research institutions. In order to improve the energy utilization rate in the vehicle running process, an optimization method of the energy consumption and recycle based on fuel cell (FC)/supercapacitor (SC) hybrid tram is proposed in this paper.

Wayside energy recovery systems (WERS), i.e. stationary energy storage systems that are connected to the tram grid, absorb this excess energy and thus improve the energy ...

Option 2: Alternative On-board Storage Solutions Many tram manufacturers now supply their trams with on-board Energy Storage Systems (OESS). Several overhead wires. While wire-free operation is the typical reason for implementing OESS, in the Melbourne context the primary purpose would be to reduce both energy consumption and peak power demand.
