Can energy storage be a strategic investment under competition?

These market dynamics serve as a motivation for this study to understand strategic investments in energy storage under competition, taking into account storage impact on the market price. Our work uses energy arbitrage as a test case with the intent to explore additional services in the future.

Should investors invest in energy storage technology?

For those who decide to invest, limited and declining revenue prospects could lead to competing strategies of energy storage investment and operation, where investors opt for technologies with specific technical attributes in the competitive market.

Is energy storage a price-maker?

When it comes to accounting for energy storage as a price-maker, some studies (e.g., , , , ) only consider the operation of the energy storage asset without accounting for the decision and cost of the storage energy- and power-capacity investment itself.

Can multiple energy storage investors invest in heterogeneous storage technologies?

Our work studies the strategic investment behavior among multiple energy storage investors in CAISO. These investors can choose to invest in heterogeneous storage technologies. At the beginning of an investment horizon, each investor decides the invested energy and power capacities.

How does energy storage work?

First, energy storage usually has a low operation cost since no fuel is directly consumed , . Then, the profit-seeking investors will always charge the storage at the lowest prices during the day. To get non-negative revenue, the investor's cost from charge must be no higher than the market revenue from the discharge (at high prices).

Is electricity storage an economic solution?

Electricity storage is currently an economic solution of-grid in solar home systems and mini-grids where it can also increase the fraction of renewable energy in the system to as high as 100% (IRENA,2016c). The same applies in the case of islands or other isolated grids that are reliant on diesel-fired electricity (IRENA,2016a; IRENA,2016d).

However, with the reduced costs of solar and energy storage in 2023, the utility-scale photovoltaic (PV) and large storage market in Europe are experiencing a gradual boom. The scale of energy storage projects is on the rise, propelling Europe to the forefront of the world's new energy transformation planning.

In contrast, investment cost for pumped hydro plants has increased as more capacity is deployed. A technology's future investment cost can be projected by extending its experience curve forwards to future amounts of cumulative installed capacity. Experience curves are a tool to project future investment cost in a structured way.

We develop a game-theoretical framework for strategic investments in energy storage. The framework derives a centralized optimization problem to compute the Nash ...

energy storage technologies in general--a fertile sector for private sector lending. Importantly, the value provided by energy storage technologies is reflected by an impressive market growth outlook. Between 2020 and 2035, energy storage installations are forecast to grow more than 27 times, attracting close to \$400 billion in investment.

The data originate from the List of Basic Data of China's Power Statistics (2009-2019), the Annual Development Report of China's Power Industry (2016-2020), the Global Sustainable Energy Investment Trend (2019) issued by the United Nations Environment Programme, and the Global Renewable Energy Power Generation Cost (2019) issued by IRENA.

Accounting the cost of energy storage for frequency regulation is an important step for the development of energy-saving frequency regulation compensation strategy, which can help to promote the development of ESS to ...

This report from the International Renewable Energy Agency (IRENA) proposes a five-phase method to assess the value of storage and create viable investment conditions. IRENA's Electricity Storage Valuation Framework (ESVF) aims to ...

This study explores the challenges and opportunities of China's domestic and international roles in scaling up energy storage investments. China aims to increase its share of primary energy from renewable energy sources from 16.6% in 2021 to 25% by 2030, as outlined in the nationally determined contribution [1]. To achieve this target, energy storage is one of the ...

Experience rates for electricity storage technologies range from -3% to 30%. The highest rates belong to lithium-ion cells (30%), packs (24%), and utility-scale systems (19%); ...

This whitepaper reflects on available opportunities across the battery energy storage industry focusing on the market development in the United States and Canada. Highlighting throughout the importance this holds for investors, developers, and suppliers. As energy storage is pivotal in enabling the energy transition across sectors, working

The production cost for the energy carriers consists of four main elements; investment cost, gas usage cost, non-gas operations cost, and BOG cost. LNG has almost an equal share of cost between investment cost and gas usage cost of around 30% each. BOG represents 0.18% of the total production cost.

What role does cost analysis play in the evolving power retention market? Conducting a cost analysis for energy storage is essential for stakeholders to optimize investments in power reserve solutions, especially amidst regulatory changes and market trends.

The transition to a low-carbon electricity system is likely to require grid-scale energy storage to smooth the variability and intermittency of renewable energy. This paper investigates whether private incentives for operating and investing ...

The large-scale development of energy storage began around 2000. From 2000 to 2010, energy storage technology was developed in the laboratory. Electrochemical energy storage is the focus of research in this period. From 2011 to 2015, energy storage technology gradually matured and entered the demonstration application stage.

investments. In the past, Battery Energy Storage Systems were not economical due to the high upfront investment costs and the low profit expectations. However, prices of energy storage systems decreased significantly over the past few years falling from close to 600 \$/kWh in 2016 to 279 \$/kWh in 2021. A further de-
