How much does hydrogen cost per kilogram?

At the time of the Argonne National Laboratory study, hydrogen cost \$13-\$16 per kilogram at refuelling stations in California. On a cost per kilogram basis, just 15% of this cost is due to production (~\$2/kg). Roughly 50% of the hydrogen cost is from the station (equipment like compressors and on-site storage) and 35% is from distribution.

How can hydrogen station technology reduce cost?

Hydrogen station technology likewise has clear pathways for cost reduction. Several components, such as compressors and dispensers, can reach lower cost simply from increased production volume. Innovation in compressors can further reduce costs and increase reliability.

Can a hydrogen storage system be used for energy?

Furthermore, the utilization of a hydrogen storage system for energy, based on a 0 % LPSP, demonstrates the feasibility of disconnected wind power generation while maintaining stringent LPSP criteria.

How much does hydrogen cost for heavy-duty trucking?

Heavy-duty trucking stakeholders, from fleet owners to original equipment manufacturers (OEMs), often cite \$4-5/kg as the required price of hydrogen for hydrogen trucking to reach cost-parity with diesel. So clearly driving down the cost of production is insufficient to reach the cost target needed to spark hydrogen uptake.

How will transport costs for hydrogen change over time?

The truck transport costs for hydrogen will also come down over time: as more hydrogen production plants are built, the average distance between production locations and fuel stations will decrease, bringing down delivery distances and costs.

Why is a wind turbine-hydrogen storage system the most cost-effective option?

Capital expenses associated with wind turbines and hydrogen storage systems significantly contribute to the overall cost. Consequently, the wind turbine-hydrogen storage system emerges as the most cost-effective and reliable option due to its low cost of energy.
