Recent developments have replaced macroscopic plates or foil electrodes by metallization directly onto the insulating dielectric. Capacitors form a technology that permits electrical energy to be stored over a long charging time and then released as required over short (submicroseconds to multimilliseconds) periods and under controlled conditions.

Q: How much power does a 1 farad capacitor hold? A: The amount of energy a 1 farad capacitor can store depends on the voltage across its plates. The energy stored in a capacitor can be calculated using the formula E =  $0.5 * C * V^2$ , where E is the stored energy, C is the capacitance (1 farad), and V is the voltage across the capacitor.
