What is latent heat storage?

2.2. Latent heat storage Latent heat storage (LHS) is the transfer of heat as a result of a phase change that occurs in a specific narrow temperature range in the relevant material. The most frequently used for this purpose are: molten salt, paraffin wax and water/ice materials .

Can a cascaded latent heat thermal energy storage system improve charging and discharging?

Nonetheless, it was also explained how the charging rate of the PCM material can significantly be enhanced with the increase in heat transfer and how cascaded latent heat thermal energy storage system are used as an ideal solution to improve charging and discharging of PCM based thermal storage systems.

How to improve thermal capacity and power in latent heat storage systems?

To improve the trade-off between thermal capacity and power in conventional latent heat storage systems, additives (e.g., nanoparticles, carbon nanotubes, etc.) and extended surfaces (e.g., fins, aerogels, metal matrix, etc.) are typically used, but this comes at an additional cost to the system.
