However, the intermittent nature of these energy sources also poses a challenge to maintain the reliable operation of electricity grid. In this context, battery energy storage system (BESSs) provide a viable approach to balance energy supply and storage, especially in climatic conditions where renewable energies fall short.

What is the energy density of Mt-LMB batteries?

Taking advantage of the high capacity of both the Li anode and S or Se cathode, the theoretical energy density can reach $\sim 1850 \text{ Wh kg}^{-1}$ and $\sim 920 \text{ Wh kg}^{-1}$ for $\text{Li}||\text{LLZTO}||\text{S}$ and $\text{Li}||\text{LLZTO}||\text{Se}$ batteries, exceeding most grid-scale energy storage systems [120,121]. In addition to the Na and Li, Alkali metal potassium (K) is also used for MT-LMB.

Are all-liquid batteries a good alternative to conventional batteries?

All-liquid batteries comprising a lithium negative electrode and an antimony-lead positive electrode have a higher current density and a longer cycle life than conventional batteries, can be more easily used to make large-scale storage systems, and so potentially present a low-cost means of grid-level energy storage.
