

How is methane produced?

Process flexible operation achieved by a bidirectional connection with the grid. Energy- and cost-efficient production of methane in a continuous manner. Costs of methane in different scenarios range from 60 to 161.6 EUR/MWh. Power-to-methane (PtM) coupled with renewables requires an energy buffer to ensure a steady and flexible operation.

What is the penetration of renewables in methane production?

A renewables penetration of 92.4% was achieved for methane production with an LCOCH<sub>4</sub> of 181.12 EUR/MWh at L<sub>cap</sub> = 3,000. As L<sub>cap</sub> increases to more than 3,000 tonnes, the penetration of renewables and the ratio of renewable energy to the grid do not change noticeably.

How many synthetic methane production projects are there?

The other project is the 'Therenga PtG plant' from Frankfurt, Germany. In this case, too, according to a press release by ITM Power, which supplies water electrolyzer equipment, the project's purpose was to produce hydrogen, not synthetic methane. Thus, after verifying the data, a total of 44 synthetic methane production projects were analyzed.

Which methane production projects are included in the IEA Database?

Of the methane production projects included in the IEA database, those were included in the study's P2M dataset that identified synthetic methane production for transport or feeding into the natural gas network as the area of use.

How is synthetic methane used?

In a total of 4 cases, the synthetic methane produced was used for electricity generation, and in 1 case of these it was utilized in a methane fuel cell, while thermal utilization took place in the rest of the 4 projects. In a further 3 projects, there was no specific use of the generated gas.

How does power-to-methane work?

Power-to-Methane coupled with renewables via liquid CO<sub>2</sub> energy storage. Process flexible operation achieved by a bidirectional connection with the grid. Energy- and cost-efficient production of methane in a continuous manner. Costs of methane in different scenarios range from 60 to 161.6 EUR/MWh.

Coalbed methane (CBM) resources in China have been estimated to exceed 36 Tcm. As of 2014, there were ~9300 producing CBM wells in China with an annual production of ~4.4 Bcm. To satisfy its need for energy and to ...

Clathrate hydrates are non-stoichiometric, crystalline, caged compounds that have several pertinent applications including gas storage, CO<sub>2</sub> capture/sequestration, gas separation, desalination, and cold energy storage. ...

In addition to this, the fossil fuel reserves are decreasing while the demand for energy is rapidly rising. Climate change, the depletion and geographical segregation of fossil fuel resources, health related issues as well as energy ...

One of the most pressing challenges to be addressed is the large-scale and long-term storage of electricity from renewable sources. By the utilization of the significant storage ...

CO<sub>2</sub> emissions have increased since industrial revolution and more significantly since 1970 [2, 3].GHG emissions are a global issue that has been of concern to the scientific ...

P2G technology allows for long-term, seasonal energy storage and a large amount of energy storage. However, the technology has low conversion efficiency and the risk of methane leakage when applied.

Topics covered include: hydrogen absorption for storage; power-to-gas for energy system integration and storage; methanation for power-to-gas applications; production of hydrogen ...

Power to gas (P2G) is a technology that converts electricity into gases like H<sub>2</sub> and O<sub>2</sub> and is expected to meet

future high-capacity energy storage needs. In this paper, we present an...

The P2G technology that has been maturing in recent years offers a new way of thinking about the storage and utilization of large amounts of renewable energy: through P2G ...

sH hydrates are known to have higher methane storage capacity in comparison to sII hydrates and thus methane hydrate formation using suitable sH promoter can reduce the ...

An ever-increasing global energy demand with subsequent development in solar and wind energy systems has made the compelling case for investigations on renewably powered synthetic reactors for the production of hydrogen and ...
