Can mobile energy storage systems be used in an active distribution network?

Mobile energy storage systems (MESSs) are able to transfer energy both spatially and temporally, and thus enhance the flexibility of grid in normal and emergency conditions. In this paper, a multi-objective framework is presented for planning of MESSs in an active distribution network (ADN).

What is mobile energy storage?

Mobile energy storage (MES) has the flexibility to temporally and spatially shift energy, and the optimal configuration of MES shall significantly improve the active distribution network (ADN) operation economy and renewables consumption.

What is the optimal scheduling model of mobile energy storage systems?

Resilience of distribution network is enhanced through bilevel optimization. Optimized solutions can reduce load loss and voltage offset of distribution network.

What is a mobile energy storage system (mess)?

During emergencies via a shift in the produced energy, mobile energy storage systems (MESSs) can store excess energy on an island, and then use it in another location without sufficient energy supply and at another time, which provides high flexibility for distribution system operators to make disaster recovery decisions.

Do mobile energy storage systems have a bilevel optimization model?

Therefore, mobile energy storage systems with adequate spatial-temporal flexibility are added, and work in coordination with resources in an active distribution network and repair teams to establish a bilevel optimization model.

We propose an MBESS distribution planning model, which optimally determines both the driving path of the carrier and the temporal-spatial BESS allocation and collection decisions to/from the customers.
