

What is mutual inductance?

In other words, the mutual inductance is the geometric mean of the self inductances. An ideal mutual inductor is made from a primary coil of inductance  $5\text{mH}$  and a secondary coil of inductance  $10\text{mH}$ . Find the value of the Mutual Inductance. A mutual inductor has two coils tightly wound over each other.

How is energy stored in an inductor?

Energy flows into an ideal ( $R = 0$ ) inductor when current in inductor increases. The energy is not dissipated, but stored in  $L$  and released when current decreases. -The energy in an inductor is stored in the magnetic field within the coil, just as the energy of a capacitor is stored in the electric field between its plates.

What is mutual inductance of two coils?

The Mutual Inductance of two coils is In the ideal case, the mutual inductance is the geometric mean of the self inductances i.e. The potential difference across a coil is:  $V = V_{\text{dotted end}} - V_{\text{plain end}}$ . The energy stored in the magnetic field of an inductor is Joule The energy density of a magnetic field is  $\text{J.m}^{-3}$  In LC Oscillations:

How does a Magnetic Inductor store energy?

The instantaneous power received by the inductor is not dissipated as heat, but stored in a magnetic field in its interior, and the energy can be recovered. This says that the amount of energy stored in the magnetic field depends on the square of the current passing through it.

What are mutually coupled inductors?

Mutually coupled inductors in series in series, which are magnetically coupled and have a mutual inductance  $M$ . The magnetic field of the two inductors could be aiding or opposing each other, depending on their orientation (fig 6.1). Fig. 6.1. Mutually coupled inductors and dot convention: a) series aiding inductors; b) series opposing inductors.

How do you calculate mutual inductance?

Find the mutual inductance of the two coils, assuming the magnetic field of the primary coil is uniform through the secondary coil. In the absence of magnetic materials the Mutual Inductance can (in principle) be calculated from the geometry of the linked coils. However in practice this is usually difficult and it is measured experimentally.

It can be seen that the mutual inductance  $j\omega M$  is given as mutual resistance:  $j\omega M = j0.5\Omega$ . First we are going to create an equivalent circuit by replacing the mutual inductance with dependent source (fig. 6.9). Since both currents  $I_1$  and  $I_2$  enter the dots, the dependent sources are with plus sign. Next we write the system of equations ...
