How is natural gas stored?

Natural gas may be stored in several different ways. In the modern world, natural gas is most commonly held in inventory underground under pressure in three main types of facilities. These underground facilities are (1) depleted reservoirs in oil and/or natural gas fields, (2) aquifers, and (3) salt cavern formations.

What percentage of natural gas is stored underground?

Approximately, 20% of all natural gas consumed during the 5-month winter heating season each year are supplied by underground storage. There are three principal types of underground storage sites used in the United States today: depleted natural gas or oil fields (80%), aquifers (10%), and salt formations (10%).

When was natural gas first stored underground?

The first instance of natural gas successfully being stored underground occurred in Ontario, Canada, in 1915. This storage facility used a depleted natural gas well that had been reconditioned into a storage field. In the United States, the first storage facility was developed just south of Buffalo, New York.

What are the different types of underground natural gas storage?

There are three main types of underground storage: 1. 2. 3. In addition to underground storage, however, natural gas can be stored as liquefied natural gas (LNG), which also allows natural gas to be shipped and stored in liquid form. Underground natural gas storage fields grew in popularity shortly after World War II.

Why is natural gas storage important?

Natural gas storages store surplus natural gas during the valley demand period and redistribute them at the peak demand period [92,93]. The stored natural gas can also ensure the continuous gas supply when the long-distance transmission malfunctions [94,95]. UGS plays a crucial role in the seasonal peak-shaving in some parts of China [96,97].

As a bridge for the transition from fossil energy to new energy, natural gas is a transitional form of clean energy. Under the impetus of the development of social civilization and the advancement of science and technology [1], energy develops from the solid (wood + coal), the liquid (oil) to the gaseous (natural gas). Natural gas, as an indispensable bridge connecting the ...

Natural gas is stored in large volumes in underground facilities and in smaller volumes in tanks above or below ground. The United States uses three main types of underground natural gas storage facilities: Depleted natural gas or oil fields--Most natural gas storage is in depleted natural gas or oil fields that are close to consuming areas.

Especially in recent years, natural gas has received a substantial amount of attention as a source of automotive fuel in many countries [25,26]. Moreover, the global proved reserve of natural gas is much larger than that of the oil, so the exploring and exploiting of natural gas plays a key role in global energy production and consumption [27].
