

Optimal configuration of wind-hydrogen energy storage system

What is a wind and solar hydrogen storage capacity configuration model?

Literature builds a typical wind and solar hydrogen storage capacity configuration model based on wind energy, solar photovoltaic, electric energy storage, and hydrogen production equipment, Then establishes a demand response model of day-ahead segmented electricity price load to reduce the total cost of running the system.

How to optimize the configuration of hydrogen energy system?

Change in hydrogen production efficiency is considered to optimize the configuration of the hydrogen energy system. A bi-level mixed integer linear programming model is proposed to plan the optimal capacity of hydrogen energy system. A data-driven surrogate algorithm for solving the bi-level mixed integer linear programming model is proposed.

Can hydrogen storage system and hydrogen supply chain equipment reduce wind curtailment?

This paper studies configuration of hydrogen storage system and hydrogen supply chain equipment in the regional integrated energy system, aiming at reducing wind curtailment and total cost. Firstly, a regional integrated energy system model with hydrogen storage system and hydrogen supply chain equipment is established.

What is the output power of a hydrogen energy storage system?

Before the optimal configuration of the hydrogen energy storage system, a variance of the output power of the whole system was 9171.78 kW². After the optimal configuration, the variance of the whole system's output power is 6582.22 kW², with an obvious decrease in the fluctuation of the output power.

What is a hydrogen energy storage system?

The use of a hydrogen energy storage system allows for the storage of excess electricity from wind and solar energy abandonment, realizing the use of clean energy in the form of integrated energy of electricity-hydrogen-electricity, and improving the efficiency of the available renewable energy sources.

How does a hydrogen storage tank reduce abandoned wind energy?

To reduce abandoned wind energy, the HES, which includes an electrolyzer (EL), hydrogen storage tank (HST), and fuel cell (FC), is incorporated. The EL utilizes excess wind power to produce hydrogen, while the FC generates electricity energy from hydrogen energy.

With the increasing requirements for energy conservation and carbon reduction, hydrogen energy storage gradually shows its advantages in power system regulation. At present, there have been many studies on the planning and configuration of hydrogen energy storage.

Optimal configuration of hydrogen energy storage in an integrated energy system considering variable ... [11].

Optimal configuration of wind-hydrogen energy storage system

To address the problem of the curtailment of wind energy, incorporating hydrogen energy storage (HES) in the IES is a promising solution, especially HES based on the electrolysis of water [12], as this type of HES can use surplus wind ...

The optimal configuration of energy storage system capacity is one of the effective measures to reduce the cost of Microgrid. A method for optimizing the capacity allocation of ...

Hydrogen energy, as a medium for long-term energy storage, needs to ensure the continuous and stable operation of the electrolyzer during the production of green hydrogen using wind energy. In this paper, based on the ...

This paper studies configuration of hydrogen storage system and hydrogen supply chain equipment in the regional integrated energy system, aiming at reducing wind curtailment and ...

Putting together more than one energy resource with some energy storage facility can be the way forward to synchronize the demand and supply curves [4]. The combination of two or more renewable sources with or without conventional source and storage is called a hybrid renewable energy system (HRES), as shown in Fig. 1, where the complementarity of ...

The multi-energy supplemental Renewable Energy System (RES) based on hydro-wind-solar can realize the energy utilization with maximized efficiency, but the uncertainty of wind-solar output will lead to the increase of power fluctuation of the supplemental system, which is a big challenge for the safe and stable operation of the power grid (Berahmandpour et al., 2022; ...

Battery energy storage systems have widely been used in microgrids to manage the issue of intermittent energy supply caused by the RESs. The disadvantages of batteries include, large size, limited lifespan, and high cost. For this reasons, energy planners are looking into hydrogen-based storage systems as a potential solution.

The results show that the optimal energy storage configuration is composed of 132.62 MW electrolyser, 49.68 MW fuel cell and 1100.75 km³ hydrogen storage tank. The ...

Hydrogen energy storage system includes electrolyzers, storage tanks and fuel cells. The electrolyzer unit utilizes electricity to electrolyze water into hydrogen and oxygen. ... The rank 1 in Table 8 is the optimal configuration for the wind/PV/hydrogen system. The global optimal solution, which consists of 16 wind turbines, 256 PV panels, 27 ...

In the context of building a clean, low-carbon, safe, and efficient modern energy system, the development of renewable energy and the realization of efficient energy consumption is the key to achieving the goal of emission peak and carbon neutrality []. As a terminal energy autonomous system, the park integrated energy

Optimal configuration of wind-hydrogen energy storage system

system (PIES) helps the productive operation ...

Firstly, we established steady-state models of the wind turbine, alkaline electrolyzer, lead-acid battery, and proton exchange membrane fuel cell in matrix laboratory ...

The optimal configuration of energy storage system capacity is one of the effective measures to reduce the cost of Microgrid. A method for optimizing the capacity allocation of wind, photovoltaic and hydrogen energy storage hybrid systems considering the whole life cycle economic optimization was established. Firstly, this paper establishes various benefit and cost ...

Improved NSGAII algorithm for capacity configuration can solve "impossible triangle" problem. Different energy storage forms are analyzed in off-grid and grid-connected ...

Literature [7] proposes a quantitative optimal configuration method for a wind and solar complementary power supply system. Literature [8] puts forward an optimization strategy ...

It also provides an optimal configuration of the system to improve the economy and the environmental benefit. ... Fei Wu et al. [23] proposed a combined energy system composed of wind power-photovoltaic-energy storage salt cavern with hydrogen as the energy scheduling carrier. In particular, the system utilizes a hydrogen storage salt cavern as ...

Driven by the development of renewable energy systems, recent research trends have mainly focused on complementary power generation systems. In terms of using hydropower or energy storage to flatten the fluctuation of wind/solar energy or to improve the utilization rate of wind/solar energy, Li et al. [5] proposed a real-time control strategy for energy storage devices ...

Wind and solar energy are paid more attention as clean and renewable resources. However, due to the intermittence and fluctuation of renewable energy, the problem of abandoning wind and photovoltaic power is serious in China. Hydrogen production by water electrolysis is the effective way to solve the problem of renewable energy absorption. ...

In addition, significant progress has been made in developing and applying of energy storage systems (ESSs) [10, 11]. Therefore, the objective of this study was to investigate a hybrid energy system (HES) with a hydrogen energy system. The basic structure of the proposed HES is shown in Fig. 1.

The on-grid WPS-HPGS primarily comprises a photovoltaic generation system, wind generation system, energy storage system, electrical load, and control system, as depicted in Fig. 2. The photovoltaic and energy storage systems are linked to the DC bus via a DC/DC converter, whereas the wind power is connected to the AC bus through an AC/DC/AC ...

Optimal configuration of wind-hydrogen energy storage system

Optimal configuration of multi microgrid electric hydrogen hybrid energy storage capacity based on distributed robustness ... Each microgrid is composed of four parts: wind and solar power generation system, hydrogen energy storage system (including electrolytic cells, hydrogen storage tanks, and fuel cells), shared energy storage system, and ...

Extreme disasters have become increasingly common in recent years and pose significant dangers to the integrated energy system's secure and dependable energy supply. As a vital part of an integrated energy system, the ...

The constructed wind-solar-hydrogen storage system demonstrated that on the power generation side, clean energy sources accounted for 94.1 % of total supply, with wind and solar generation comprising 64 %, storage system discharge accounting for 30.1 %, and electricity purchased from the main grid at only 5.9 %, confirming the feasibility of ...

However, the intermittence of renewable energy and the different operating characteristics of facilities present challenges to IES configuration. Therefore, a two-stage decision-making framework is developed to optimize the capacity of facilities for six schemes comprised of battery energy storage systems and hydrogen energy storage systems.

Abstract: Due to the high proportion of renewable energy access, the reasonable capacity allocation of each unit of the system is the premise to ensure the economic, environmental protection and reliable operation of the system. A grid-connected hybrid energy storage system with hydrogen energy storage and battery is proposed, which takes the total annual net ...

The key findings of this study from the simulation results are summarized as follows: 1) The coordinated configuration of hybrid electricity and hydrogen storage fully combines the advantages of long-term energy storage and flexible charging/discharging, resulting in the renewable energy consumption rate of 98.873 % while ensuring the ...

The hydrogen energy storage system can initially be viewed as an ideal storage system that takes in hydrogen during the charging process, stores for an extended period without any loss, and releases it during the discharging process based on the current energy demand. ... deficits, low system cost, and stable power supply. The optimal ...

Abstract: This paper presents a novel approach to enhance the integration of wind power into the grid and alleviate wind power fluctuations. Specifically, a hybrid energy system, consisting of ...

The W-HES offer an effectively solution to the above problems by using the curtailment wind to produce hydrogen. The optimal capacity planning configuration of HSUs has a significant impact on the operation and economics of W-HES. Ref. [2] use batteries and hydrogen as hybrid energy storage to build an off-grid WP

Optimal configuration of wind-hydrogen energy storage system

hydrogen production system with optimized ...

Configuring a certain capacity of ESS in the wind-photovoltaic hybrid power system can not only effectively improve the consumption capability of wind and solar power generation, but also improve the reliability and economy of the wind-photovoltaic hybrid power system [6], [7], [8]. However, the capacity of the wind-photovoltaic-storage hybrid power system (WPS-HPS) ...

The results show that the optimal number of 200 kW electrolytic cells, 6 kg hydrogen storage tanks and 200 kW fuel cells are 268, 291 and 222, respectively. The ...

Hydrogen can be produced from varieties of feedstock. Its ability to reduce the intermittency of renewable energy, along with its versatility in terms of producing or storing energy make it the perfect complement in a system in which renewable energies are the key players. Under the background of integrated energy system (IES), the hydrogen storage system and hydrogen ...
