What is a lithium-ion battery state of charge (SOC)?

The accurate estimation of lithium-ion battery state of charge (SOC) is the key to ensuring the safe operation of energy storage power plants, which can prevent overcharging or over-discharging of batteries, thus extending the overall service life of energy storage power plants.

What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges from the grid or a power plant and then discharges that energy to provide electricity or other grid services when needed.

How does the state of charge affect a battery?

The state of charge greatly influences battery's ability to provide energy or ancillary services to the grid at any given time. Round-trip efficiency, measured as a percentage, is a ratio of the energy charged to the battery to the energy discharged from the battery.

How does the Spearman correlation coefficient work for energy storage battery SoC filtering? For the energy storage battery SOC filtering. Combined with Conclusion 1 and the properties of the Spearman correlation coefficient P: For a data pair (X,Y),when X is unchanged and Y is changed,its P will not changeas long as the bit values at the corresponding positions between X and Y remain unchanged.
