The electrode material impacts the performance of LIBs and SIBs significantly. Lithium metal oxides (LiMO 2) are the most common cathode materials in LIBs. They act like a stable storage space for lithium atoms, in other words, lithium is intercalated between layers of LiMO 2. Titanium disulfide (TiS 2) was first discovered in 1978 and was the first intercalation ...

In the past decade, additional micro and mesoporous materials have emerged, such as porous organic polymers (POPs), crystalline covalent-organic frameworks (COFs), and metal-organic frameworks (MOFs) [14, 15]. These materials find extensive application in catalysis, each with its own distinct characteristics [16]. Among these, POPs stand out due to their non ...
