

# Power transmission distribution and energy storage systems

What is the purpose of distribution in an electric power system?

Distribution fulfills the demand of the consumers at certified voltage level and it is done in terms of feeders. Generation means the conversion of a form of energy into electrical energy. Transmission implies the transport of this energy to very long distance with very high amount of voltage magnitude.

What is a power station and a consumer?

In an electric power system, a power station (generating station) produces electricity, and a consumer uses it. The lines network between these two can be divided into primary and secondary transmission and distribution systems.

What are the different types of energy storage systems?

The main power electronics equipment is the D-STATCOM, the DVR, and the SSTS, whereas the main electrical power generators are solar PV panels, small-scale wind power generators, and fuel cells. To date, the most popular energy storage system is the Li-ion battery, particularly as the widespread adoption of EVs accelerates on a global scale.

What is the purpose of transmission in the electric power system?

Transmission implies the transport of this energy to very long distance with very high amount of voltage magnitude. After these five levels, the energy must be available as the stated form in terms of voltage magnitudes, frequency and consistency. Generation means the conversion of a form of energy into electrical energy.

What are the parts of a power supply system?

Fig 4: Typical Electric Power Supply Systems Scheme (Generation, Transmission & Distribution of Electrical Energy) A power supply system consists of three main parts: Generation, Transmission, and Distribution. Secondary distribution can be further divided into three parts.

What is a power distribution system?

The power distribution system is the final stage in the delivery of electric power to individual customers. Distribution grids are managed by IOUs, Public Power Utilities (municipals), and Cooperatives (co-ops) that operate both inter- and intra-state. IOUs are typically regulated by state PUCs.
