How is energy stored electrochemically?

In principle, energy is stored electrochemically via two processes known as the faradaic and non-faradaic processes. The faradaic process is also known as the direct method, in which electric energy is stored by converting it into chemical energy via the oxidation and reduction of an electrochemically active material.

What determines the stability and safety of electrochemical energy storage devices?

The stability and safety, as well as the performance-governing parameters, such as the energy and power densities of electrochemical energy storage devices, are mostly decided by the electronegativity, electron conductivity, ion conductivity, and the structural and electrochemical stabilities of the electrode materials. 1.6.
