However, to properly include them in the development of these future systems a broad understanding of their current capabilities, industrial implementation, and future potential is necessary.

What is a protection relay?

(protective relaying) The maximum distance from the relay location to a fault for which a particular relay will operate. The reach may be stated in terms of miles, primary (of a relay) The extent of the protection afforded by a relay in terms of the impedance or circuit length as measured from the relay location.

What are electrical energy storage systems (EESS)?

Electrical energy storage systems (EESS) for electrical installations are becoming more prevalent. EESS provide storage of electrical energy so that it can be used later. The approach is not new: EESS in the form of battery-backed uninterruptible power supplies (UPS) have been used for many years. EESS are starting to be used for other purposes.

What is a measuring relay?

A generic term covering those forms of measuring relays in which the response to the input quantities is a function of the electric circuit distance (impedance) between the point of measurement and the point of fault.
