What is an automatic changeover switch?

An automatic changeover switch is an electrical device designed to automatically switch between two or more power sources in the event of a failure or an unreliable primary power source. The device is commonly applied on installations involving a utility grid and backup power sources that may include generators or renewable energy systems.

Why are automatic transfer switches important?

Automatic transfer switches are essential in these environments to ensure that servers, networking equipment, and storage systems remain powered during power disruptions. By automatically transferring the load to backup power sources, these switches prevent costly downtime, data corruption, and potential financial losses.
