#### How do weather events affect water storage capacities in reservoirs?

Weather events such as drought and precipitation impact water storage capacities in reservoirs. Predictive insights on reservoir storage levels are beneficial for water planners and stakeholders in effective water resource management.

### Can water storage reservoirs be harmoniously incorporated into the environment?

The conclusion is that water storage reservoirs can be harmoniously incorporated into the environment. Serbia has a limited number of locations suitable for the construction of reservoirs, therefore it is necessary to retain these areas for storage in regional development plans and other legal acts. ### Why is predicting reservoir storage capacities important?

Predicting reservoir storage capacities is an important planning activity for effective conservation and water release practices. Weather events such as drought and precipitation impact water storage capacities in reservoirs.

Can deep learning predict reservoir storage levels?

Predictive insights on reservoir storage levels are beneficial for water planners and stakeholders in effective water resource management. A deep learning (DL) neural network (NN) based reservoir storage prediction approach is proposed that learns from climate, hydrological, and storage information within the reservoir's associated watershed.

Why do water resource managers need better reservoir storage prediction?

Extreme climate hazards and the increased scarcity and demand for fresh waternecessitates improvements in reservoir storage prediction. The research goal is to provide water resource managers with improved ability to make informed decisions about water usage that minimize impacts to local communities and businesses.

Where are reservoir storage capacity statistics based?

The map of reservoir storage capacity statistics (Fig. 10b) shows that the areas with larger capacities are mainly located in the central and southwest parts of China, such as the middle mainstream and upstream of Yangtze, the upper Pearl, and the Lancang River.

Water harvesting is a traditional conservation technique, and there is general agreement that conserving water will promote agricultural production, especially in arid and semi-arid regions.

Our results suggest that rigid allocation mechanisms and inefficient management objectives result in a decrease of up to 13% in the value generated from stored water when compared to a free trade scenario, an ...
