

Can soybean wax cooling system reduce PV temperature?

The experiment show that PV applied with soybean wax as a passive cooling system can reduce the maximum PV temperature at 1100 W/m² intensity from 60.7° to 54.7° and increase its maximum efficiency by 0.42% at 900 W/m² intensity. Soybean wax cooling system has proven to be effective in reducing PV temperature.

What is the thermal conductivity of soy wax?

The thermal conductivity of soy wax increased with the ratio of pure soy wax and nano-soy wax; the thermal conductivity was 6.01 for soy wax+graphene and 5.71 for soy wax+Ti₃AlC₂. Differential scanning calorimetry (DSC) results showed an increase in the melting and solidifying points of pure soy wax.

What is thermal energy storage?

Thermal Energy Storage (TES) has been widely used to address fluctuations in energy demand and supply gaps. There are three forms of TES: Latent Heat Thermal Energy Storage (LHTES), Sensible Heat Thermal Energy Storage (SHTES), and thermochemical storage systems (Nomura et al., 2015).

Does soy wax have a thermal cycle?

In a study conducted by (Trisnadewi et al., 2021), pure soy wax thermal cycle test results were obtained. Thermal cycling tests were performed with heating and cooling cycles of 0, 500, 1000, 3000, and 5000.

What is the absorption peak of soy wax?

Soy wax has an absorption peak in 1702-1738 cm⁻¹, which indicates the absorption of the strain vibration of the carboxylate group (C=O). After synthesizing the spectra of the PCM samples, soy wax+graphene (Figure 2 (b)) and soy wax+Ti₃AlC₂ (Figure 2 (c)) show similar peak spectra to those of pure soy wax.

Does PCM soy wax conduct heat?

The presence of carbon and aluminum in PCM soy wax can increase the thermal conductivity of the material, increasing the ability of PCM soy wax to conduct heat. Based on the EDS test, the carbon value of MAXene can approach the carbon content in graphene, namely 82.2 wt.% in Ti₃AlC₂ and 84.49 wt.% in graphene.

Moreover, compared to pure paraffin, the prepared microcapsules have superior thermal stability and high reliability, which shows promising energy storage efficiency of 91.5% even after 50 hot-cold cycles.

The sudden rise in the gas and oil price due to political issues and the goal demand to reduce CO₂ emissions to nearly zero by 2050 urges scientists to provide renewable and sustainable strategies to replace fossil fuel sources or reduce the energy demand. Using thermal energy storage integrated with renewable energy sources, especially solar energy, is a ...

In this study, UV-curable, fatty alcohol containing soybean oil based phase change materials (PCMs) were

obtained and characterized. The phase transition behaviors and ...

Phase change materials (PCMs) gain significant attention for thermal energy storage [] due to their ability to store and release heat during the solid and liquid phase transition, as well as in cooling electronic devices applications []. Among various PCMs, soy wax could be an alternative candidate in applications with low temperatures because it is easy to acquire, has a ...

Thermal energy storage systems bridge the gap between energy supply and energy demand, thereby making solar thermal energy available on-demand. Thermal energy storage systems based on latent heat storage have the benefits of higher energy density and capability to deliver heat at a constant temperature. While the former ensures lower foot-print ...

This study aims to reduce the absorption of heat received in the building with the modification of building walls by adding Phase Change Material (PCM) as Thermal Energy Storage (TES). Soy wax is ...

They have a variety of applications in thermal energy storage units [1], [2], ... Cui et al. [27] reported that the thermal conductivity of phase change materials (soy wax, thermal conductivity 0.324 W/m K) was improved by adding carbon nanofiber (CNF) and carbon nanotube (CNT). They used soy wax (melting temperature 52-54 °C) as a PCM and ...

The energy and exergy study of the industrial processing of soybean into soy oil also revealed that the highest energy consumption was associated with the subsystems which involved the use of thermal energy, revealing that these subsystems contributed about 88.53% to the total inefficiency of the entire system.

This study explored an innovative technique for improving the thermal characteristics of foam concrete by incorporating soy wax phase change material (PCM) encapsulated within pumice. The core of this research is the development of PCM-pumice aggregates through the macro encapsulation of soy wax. This process involves direct ...

PCMs represent a novel form of energy storage materials capable of utilizing latent heat in the phase change process for thermal energy storage and utilization [6], [7].Solid-liquid PCMs are now the most practical PCMs due to their small volume change, high energy storage density and suitable phase transition temperature.

thermal energy storage (LHTES) technique is the most attractive because of the ability of PCMs to store a very large amount of energy per unit of mass then release at almost constant temperature [6,7]. In addition, LHTES can achieve higher energy storage densities, smaller sizes of systems and narrower temperature ranges in melting and freezing ...

This study aims to reduce the absorption of heat received in the building with the modification of building walls by adding Phase Change Material (PCM) as Thermal Energy Storage (TES).
