## Speech at the discussion meeting on capacitor energy storage

What are electrochemical capacitors?

Electrochemical capacitors, a type of capacitor also known by the product names Supercapacitor or Ultracapacitor, can provide short-term energy storage in a wide range of applications. These capacitors are powerful, have extremely high cycle life, store energy efficiently, and operate with unexcelled reliability.

#### Are electrochemical capacitors good for energy conservation?

Electrochemical capacitors (ECs), often referred to by the product names Supercapacitor or Ultracapacitor, are well suited for energy conservation applications. They offer high charge-discharge efficiency, excellent cycle life, exceptional power performance, and long operational life even in harsh environments.

#### Can an electrochemical capacitor be made smaller in size?

In terms of energy density, any system with an electrochemical capacitor could of course be made smaller in size if its energy density were higher. Higher energy density would always be desirable in the interests of creating a smaller system.

#### What is the difference between a battery and a capacitor storage system?

A capacitor storage system, on the other hand, is typically sized to match the kinetic energy available for capture since it can be efficiently charged in seconds and does not have cycle-life limitations. This means a capacitor storage system is often smaller in size and lower in massthan a battery system offering comparable performance.

### What is super conducting magnetic energy storage (SMES)?

The super conducting magnetic energy storage (SMES) belongs to the electromagnetic ESSs. Importantly, batteries fall under the category of electrochemical. On the other hand, fuel cells (FCs) and super capacitors (SCs) come under the chemical and electrostatic ESSs.

### What are flexible super capacitors?

Flexible super capacitors (FSCs) Hybrid super capacitors (HSCs) Integration of perovskite-organic tandem solar cells (PSCs-OSCs) with solid-state ASCs. It has resulted in a light-weight wireless self-charging power pack with overall and energy storage efficiencies of 12.43% and 72.4%. 3.2. Electrodes, electrolytes and separators
