

What is the energy storage system?

The energy storage system includes 1.5 MW/2 h LiB, 1.2 MW/2 h VRFB. And the wind power of 99 MW had been put into operation in August 2012. The system is connected with the 35 kV bus. Through intelligent control, the system stores and releases power according to the coordinating with wind power.

Why do we need energy storage systems?

As a consequence, the electrical grid sees much higher power variability than in the past, challenging its frequency and voltage regulation. Energy storage systems will be fundamental for ensuring the energy supply and the voltage power quality to customers.

What is a supercapacitor energy storage system?

A 400 kW, 1.0 kWh supercapacitor energy storage system that aims at improving the power quality in the electrical grid, both in steady state (e.g., harmonic compensation) and during transients (e.g., fault-ride through). A 100 kW, 200 kWh battery energy storage system, that is based on distributed MMC architecture.

What are the principles of energy storage system development?

It outlines three fundamental principles for energy storage system development: prioritising safety, optimising costs, and realising value.

How to develop a safe energy storage system?

There are three key principles for developing an energy storage system: safety is a prerequisite; cost is a crucial factor and value realisation is the ultimate goal. A safe energy storage system is the first line of defence to promote the application of energy storage especially the electrochemical energy storage.
