Why is a dry air cooler more efficient than a water cooler?

Since the specific heat of air is much smaller than that of water, a dry air cooler requires more air to meet the demand for cooling process, under the condition of the same cooling duty, giving rise to higher energy consumption caused by the fan. Meanwhile, Ec of the CWS is the highest one when Tw is lower than 11 °C.

Does cool storage reduce energy consumption?

Conferences > 2022 4th International Confer... With the energy density increase of energy storage systems (ESSs), air cooling, as a traditional cooling method, lags along due to low efficiency in heat dissipation and inability in maintaining cell temperature consistency. Liquid cooling is coming downstage.

Why do air coolers use less water than CWS?

For air coolers, air with lower temperature has higher cooling ability, leading to less air volume and lower energy consumption compared with the CWS, under the same condition of cooling duty. 3.3. Analysis of water consumption Under different relative humidity, the water consumption of these cooling methods can be demonstrated in Fig. 3, Fig. 4.
