Where can compressed air energy be stored?

The number of sites available for compressed air energy storage is higher compared to those of pumped hydro [,]. Porous rocks and cavern reservoirs are also ideal storage sites for CAES. Gas storage locations capable of being used as sites for storage of compressed air .

What is compressed air energy storage?

Compressed air energy storage (CAES) is the use of compressed air to store energy for use at a later time when required,,,,. Excess energy generated from renewable energy sources when demand is low can be stored with the application of this technology.

What are the options for underground compressed air energy storage systems?

There are several options for underground compressed air energy storage systems. A cavity underground, capable of sustaining the required pressure as well as being airtight can be utilised for this energy storage application. Mine shafts as well as gas fields are common examples of underground cavities ideal for this energy storage system.

Are compressed air energy storage systems suitable for different applications?

Modularity of compressed air energy storage systems is another key issue that needs further investigation in other to make them ideal for various applications. The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

What determines the design of a compressed air energy storage system?

The reverse operation of both components to each otherdetermines their design when integrated on a compressed air energy storage system. The screw and scroll are two examples of expanders, classified under reciprocating and rotary types.

What are the different types of compressed air storage systems?

Isochoric as well as isobariccompressed air storage systems are ideal for both underground or above storage systems. The compressed air storages built above the ground are designed from steel. These types of storage systems can be installed everywhere, and they also tend to produce a higher energy density.
