Can energy storage system be a part of power system?

The purpose of this study is to investigate potential solutions for the modelling and simulation of the energy storage system as a part of power system by comprehensively reviewing the state-of-the-art technology in energy storage system modelling methods and power system simulation methods.

Are energy storage systems a key element of future energy systems?

At the present time, energy storage systems (ESS) are becoming more and more widespread as part of electric power systems (EPS). Extensive capabilities of ESS make them one of the key elements of future energy systems[1,2].

How do energy storage systems affect the dynamic properties of electric power systems?

With the development of electric power systems, especially with the predominance of renewable energy sources, the use of energy storage systems becomes relevant. As the capacity of the applied storage systems and the share of their use in electric power systems increase, they begin to have a significant impact on their dynamic properties.

How energy storage systems affect power supply reliability?

Energy storage systems are increasingly used as part of electric power systems to solve various problems of power supply reliability. With increasing power of the energy storage systems and the share of their use in electric power systems, their influence on operation modes and transient processes becomes significant.

How can energy storage models be implemented?

It should be noted that by analogy with the BESS model, the SC, FC and SMES models can be implemented considering their charging and discharging characteristics. In addition, by applying a similar approach to the design of the energy storage model itself, they can be implemented in any other positive-sequence time domain simulation tools.

What is a physical based model of energy storage systems?

For example, the physical-based modelling method of mechanical energy storage systems mainly utilise theories in mechanics, thermodynamics or fluid dynamics. The mathematical equations governing components with strong correlations are amalgamated to build the model [ , , ].
