Is super-conducting magnetic energy storage sustainable?

Super-conducting magnetic energy storage (SMES) system is widely used in power generation systems as a kind of energy storage technology with high power density, no pollution, and quick response. In this paper, we investigate the sustainability, quantitative metrics, feasibility, and application of the SMES system.

What is superconducting energy storage system (SMES)?

Superconducting Energy Storage System (SMES) is a promising equipment for storing electric energy. It can transfer energy double-directions with an electric power grid, and compensate active and reactive independently responding to the demands of the power grid through a PWM controlled converter.

Can a superconducting magnetic energy storage unit control inter-area oscillations?

An adaptive power oscillation damping (APOD) technique for a superconducting magnetic energy storage unit to control inter-area oscillations in a power system has been presented in . The APOD technique was based on the approaches of generalized predictive control and model identification.

Is SMEs a competitive & mature energy storage system?

The review shows that additional protection, improvement in SMES component designs and development of hybrid energy storage incorporating SMES are important future studies to enhance the competitiveness and maturity of SMES system on a global scale.

How is energy stored in a SMES system?

In SMES systems, energy is stored in dc form by flowing current along the superconductors and conserved as a dc magnetic field. The current-carrying conductor functions at cryogenic (extremely low) temperatures, thus becoming a superconductor with negligible resistive losses while it generates magnetic field.

Can superconducting magnetic energy storage reduce high frequency wind power fluctuation?

The authors in proposed a superconducting magnetic energy storage system that can minimize both high frequency wind power fluctuation and HVAC cable system's transient overvoltage. A 60 km submarine cable was modelled using ATP-EMTP in order to explore the transient issues caused by cable operation.
