What are ESG-related risks & opportunities in the energy system?

The energy system faces a multitude of ESG-related risks, challenges, and opportunities as it transitions from fossil-based systems of energy production and consumption to renewable energy sources.

Are grid-scale battery energy storage systems safe?

Despite widely known hazards and safety design, grid-scale battery energy storage systems are not considered as safe as other industries such as chemical, aviation, nuclear, and petroleum. There is a lack of established risk management schemes and models for these systems.

Risk assessment is a scientific discipline that has been developed over the past few decades to understand and control the risks of events. This allows the management of hazardous activities through its systematic understanding (Zio, 2018). The challenges of risk management and increasing public dissatisfaction with the risks associated with process industries are ...

It is clear that risk management is a multi-criteria decision making (MCDM) problem, as the conflicting priorities have to be accommodated while managing and mitigating the risks (Linkov et al., 2006) MCDM, decisions are made to identify the best solution from a range of options, subject to several decision criteria and constraints (Polatidis, Haralambopoulos, ...

Attenuation refers to the method of attenuating substances to make them less flammable or toxic. A more general principle includes avoidance of all types of hazardous "concentrations" such as accumulation of energy and storage of large quantities of hazardous substances in one place [30, p. 174].

Energy storage is one of the hot points of research in electrical power engineering as it is essential in power systems. It can improve power system stability, shorten energy generation environmental influence, enhance system efficiency, and also raise renewable energy source penetrations. This paper presents a comprehensive review of the most ...

Risk related to driving a car is best dealt by the driver, whereas the swine flu risk needed national and even international handling, as the threat is intrinsically borderless. A fundamental principle often applied in industry is internal control, meaning that the company has full responsibility for the activities it runs, including the risks ...

Traditional risk assessment practices such as ETA, FTA, FMEA, HAZOP and STPA are becoming inadequate for accident prevention and mitigation of complex energy power systems.
