What are the components of an electrochemical cell?

An electrochemical cell typically consists of the following three major components: electrodes, electrolyte, and membrane/separator. Most solid-state secondary batteries comprise two solid electrodes, an anode and a cathode, where the oxidation-reduction reactions proceed to function as electron generator or sink, respectively.

The electrochemical energy storage/conversion devices mainly include three categories: batteries, fuel cells and supercapacitors. Among these energy storage systems, supercapacitors have received great attentions in recent years because of many merits such as strong cycle stability and high power density than fuel cells and batteries [6,7].
