How much solar energy does an electric tractor use?

For average solar radiation of 5 kWh/ (m<sup>2</sup> day) typically available in equatorial regions, the amount of energy generated by the PV system would not only be enough to supply the electric tractor adequately, but also to inject the surplus in the utility grid.

Are electric tractor batteries a good solution?

Innovative operational planning/management of electric batteries is the solution. Electric Tractor with optimized planning of use batteries allows good autonomy. The majority of small family farms in underdeveloped regions lack appropriate motorized agricultural machinery that enables efficient farming and good productivity.

Can a tractor battery sustain a continuous energy supply?

A typical characteristic of farming activities is that during specific periods of planting, cultivation, and harvest, the tractor has to work 10 h or more in a field. Thus, the onboard battery, even one with the highest energy density and largest technically feasible capacity, cannot sustain a continuous energy supply.
