$k$  = relative permittivity of the dielectric material between the plates.  $k=1$  for free space,  $k \geq 1$  for all media, approximately  $=1$  for air. The Farad, F, is the SI unit for capacitance, and from the definition of capacitance is seen to be equal to a Coulomb/Volt.. Any of the active parameters in the expression below can be calculated by clicking on it.

If we have a parallel plate capacitor, the energy is given by  $U = \frac{1}{2} CV^2$ ; and  $C = \frac{\epsilon A}{d}$  and  $V = Ed$ ; gives energy density  $u = U/\text{Volume} = \frac{1}{2} \epsilon E^2$ ;  $= \frac{1}{2} \epsilon E^2 / 4\pi k$  Note that this holds in general for any electric field e.g. Assume that ...

A capacitor of capacitance 47 mF might typically be used in a simple circuit. For a parallel plate conductor,  $Q$  is the charge on the plates and  $V$  is the potential difference across the capacitor. Note: The charge  $Q$  is not the ...

Getting back on track, the earth's electric field is about 60 V/m. It is probably easier to extract this tiny bit of energy when it is not discharging - a little at a time. Instead of giant currents for fractions of a second every few ...

When a capacitor is faced with a decreasing voltage, it acts as a source: supplying current as it releases stored energy (current going out the positive side and in the negative side, like a battery). The ability of a capacitor ...
