The hydrogen energy is a renewable, high-power and high-efficiency energy carrier, which is convenient for conversion [[1], [2], [3] in the solar power and wind power industry is large in scale [4, 5] while its power utilization efficiency is low, and the excess electricity cannot be utilized [6]. The hydrogen energy becomes a favorable energy conversion carrier.

The energy storage cycle can then be designed and optimized to operate around average reservoir pressure. We measured reservoir performance by its injectivity and productivity indices, which quantify how high a flow rate can be achieved for a given pressure drive. The higher this value, the better-suited is the reservoir for energy storage.
