How does a water storage system work?

During charging, the air in the water storage vessel and air cavern is compressed by the pumped water. Subsequently, compressors 1 and 2 compress the air into the two tanks for energy storage. During discharging, the compressed air expands and successively transfers the pressure energy to the hydraulic turbine and expander for power generation.

How does a compressed air tank work?

As shown in Fig. 23 (b), the compressed air vessel (CAV) is used to pump water. In this case, the water in the lower section of the compressed air vessel (CAV) is discharged into the tank at a higher position. The internal energy of the compressed air is converted into the potential energy of the water.
