It is strongly recommend that energy storage systems be far more rigorously analyzed in terms of their full life-cycle impact. For example, the health and environmental impacts of compressed air and pumped hydro energy storage at the grid-scale are almost trivial compared to batteries, thus these solutions are to be encouraged whenever appropriate.

Using life cycle assessment, we determine the environmental impacts avoided by using 1 MW h of surplus electricity in the energy storage systems instead of producing the same product in a conventional process.

For instance, Jenn & Highleyman's [115] study on the distributional grid impacts of EVs in California found that - using their highest adoption scenario of six (6) million EVs in California - approximately 443 circuits within the power grid service area will need upgrades, accounting for close to 20 % of all electrical circuits. However ...

Mobile energy storage systems can help EV-based MG manage load and voltage. MG faces significant EV and load needs in EV traffic. EV power scheduling fixes MG profit profile, demand support, and cost profile [178, 179, 200]. The grid was overburdened by EVs and power failure may ensue from this huge power demand.

The increase in the penetration rate of electric vehicles will also affect the power system.
