What materials are used to store energy?

Materials like molten salts and phase-change materials are commonly used due to their high heat capacity and ability to store and release thermal energy efficiently. Mechanical energy storage systems, such as flywheels and compressed air energy storage (CAES), are used to store kinetic or potential energy.

What are the different types of energy storage?

Electrochemical Energy Storage: Storage of energy in chemical bonds, typically in batteries and supercapacitors. Thermal Energy Storage: Storage of energy in the form of heat, often using materials like molten salts or phase-change materials. Mechanical Energy Storage: Storage of energy through mechanical means, such as flywheels or compressed air.

What are materials for chemical and electrochemical energy storage?

Materials for chemical and electrochemical energy storage are key for a diverse range of applications, including batteries, hydrogen storage, sunlight conversion into fuels, and thermal energy storage.
