What is the difference between a flywheel and a battery storage system?

Flywheel Systems are more suited for applications that require rapid energy bursts, such as power grid stabilization, frequency regulation, and backup power for critical infrastructure. Battery Storage is typically a better choice for long-term energy storage, such as for renewable energy systems (solar or wind) or home energy storage.

What is a flywheel energy storage system?

A flywheel energy storage system is a mechanical device used to store energy through rotational motion. When excess electricity is available, it is used to accelerate a flywheel to a very high speed. The energy is stored as kinetic energy and can be retrieved by slowing down the flywheel, converting the motion back into electricity.

How can flywheel energy storage improve battery life & system availability?

To improve battery life and system availability, flywheels can be combined with batteries to extend battery run time and reduce the number of yearly battery discharges that reduce battery life (Figure 2). Many types of medical imaging equipment, such as CT or MRI machines can also benefit from flywheel energy storage systems.

Why do flywheel energy storage systems have a high speed?

There are losses due to air friction and bearing in flywheel energy storage systems. These cause energy losses with self-discharge in the flywheel energy storage system. The high speeds have been achieved in the rotating body with the developments in the field of composite materials.

How can flywheels be more competitive to batteries?

To make flywheels more competitive with batteries, the use of new materials and compact designs can increase their specific energy and energy density. Additionally, exploring new applications like energy harvesting, hybrid energy systems, and secondary functionalities can further enhance their competitiveness.

How long does a flywheel energy storage system last?

Flywheel energy storage systems have a long working life if periodically maintained (>25 years). The cycle numbers of flywheel energy storage systems are very high (>100,000). In addition, this storage technology is not affected by weather and climatic conditions. One of the most important issues of flywheel energy storage systems is safety.
