What is liquid air energy storage?

Liquid Air Energy Storage (LAES) is a technology that involves cooling air until it becomes liquid nitrogen and storing it in tanks. Later, the liquid is converted back to gas and used to power various activities. LAES is common in plants and industries and has a lifespan of up to 30 years per system.

What is stored in a pumped thermal energy storage system?

Pumped thermal energy storage systems consist of a hot and cold store, compressors, turbines and generators. Electricity is used to clean, compress and cool to liquefy air/nitrogen and stores energy in the form of liquid air in a tank. When discharging, the liquid air is pumped, evaporated and the expansion of air is used to drive a turbine.
