What is a superconducting magnetic energy storage system?

A superconducting magnetic energy storage (SMES) system, originally introduced by Ferrier in 1969, is a source of energy to accommodate the diurnal variations of power demands. An SMES system contains three main components: a superconducting coil (SC); a power conditioning system (PCS); and a refrigeration unit.

An illustration of magnetic energy storage in a short-circuited superconducting coil (Reference: supraconductivite.fr) A SMES system is more of an impulsive current source than a storage device for energy.

What is energy storage technology?

This technology is based on three concepts that do not apply to other energy storage technologies (EPRI, 2002). First, some materials carry current with no resistive losses. Second, electric currents produce magnetic fields. Third, magnetic fields are a form of pure energy which can be stored.

How does a SMES system store electrical energy?

However, SMES systems store electrical energy in the form of a magnetic field via the flow of DC in a coil. This coil is comprised of a superconducting material with zero electrical resistance, making the creation of the magnetic field perfectly efficient.

What causes losses in electromagnetic energy storage systems?

Losses in electromagnetic (e.g., superconducting magnetic energy storage (SMES)) energy storage systems are mainly caused by resistance.

What is electrochemical storage?
