Is summer the best month for solar energy production?

Summer has longer daylight, which results in a higher level of energy production. It's commonly assumed that summer is the best month for solar, and it's not wrong! However, there are a few drawbacks to the summer months, which make preparing for solar energy production in the Spring the most advantageous for the year.

What are peak hours for electricity consumption?

In most regions, peak hours for electricity consumption typically occur during the early morning and evening. During these hours, the demand for electricity surges, leading to increased pressure on the grid infrastructure.

Can seasonal energy storage be economically viable?

To accommodate the use of this variable energy throughout the year the grid may benefit from economically viable seasonal energy storage to shift energy from one season to another. Storage of this nature is expected to have output durations from 500 to 1000 hours or more.
