Is a capacitor more efficient than an inductor?

For the same occupancy /volume,a capacitor is a much more efficient energy storage component compared to an inductor. By an order of two magnitudes roughly. Also,for the same occupancy /volume,a capacitor can store more energy than an inductor. But,you could also factor in the method of putting energy into the capacitor or inductor.

Why do we use inductors over capacitors?

What happens if you store energy in a capacitor?

But,if you store energy in a capacitor from a ramping voltage source (for instance a constant current source),the energy lost is near-enough zero. And,if you tried to store energy in an inductor using a current source,you would lose half the energy (and be faced with a massive voltage spike).

Can you store energy in a capacitor from a voltage source?

That's not completely true, because each'll shift the phase to an opposite direction. So if you don't want the shift, you should combine the inductor and the capacitor. In some circumstances the shift is acceptable in only one direction, so you can use the capacitor or the inductor according to that. Here's a full explanation of the subject.
