The total charge can be calculated as the number of moles of electrons ( $n$ ) times the Faraday constant ( $F = 96,485 \text{ C/mol e}^-$ ). Electrical work is the maximum work that the system can produce and so is equal to the change in free energy. Thus, anything that can be done with or to a free energy change can also be done to or with a cell potential.

The applications of electrochemistry are also brought into display, be it in the fields of energy storage, corrosion processes, or latest technologies.
